Project #2 – Sandwich Order System

Introduction

You have been contracted by Super Sandwich Store to develop a Java application* which helps customers order sandwiches with customized ingredients. The application also allows staff to manage the orders.

After a discussion with the owner of the store, you received the following information about the desired functions of the system:

1a. Basic Features: Allow customer to login to:

- a. Place the order of sandwiches, whose ingredients and bread type can be selected by the customer
- b. Edit and delete the orders entered
- c. Confirm/save the orders into the data storage (vector)

1b. Basic Features: Allow staff to login to:

- a. Create the types of bread and ingredients
- b. Edit and delete the types of bread and ingredients in the menu
- c. Confirm/save the created items and their details in the data storage (vector)

2. Integration of above modules 1a and 1b: Allow staff to login to:

- a. View the summary of the orders
- b. View the details (number of sandwiches, bread type etc.) of each order
- c. Calculate the total sales (\$)
- d. Keep track of the items in the inventory

3. Bonus Features

- a. Include images for menu.
- b. Allow prices of menu items to be uploaded from a text file.
- c. Add a special promotion such as “Sandwich of the Day @ Half Price”, that costs half the price for the sandwich of the day ordered.
- d. You are not limited to the above features for scoring bonus marks.

* Adhere to MVC design model.
